IDX (Data Exchange Framework)

NBCUniversal
OPERATIONS and TECHNICAL SERVICES
MEDIA PRODUCTS & ADVANCED TECHNOLOGY

Challenge

The NBC executives/stakeholders were in need of a custom platform with tools to better manage their brands, and the members of each brand. The Identity Data Exchange (IDX) would be ⅓ part of this initiative providing a member profile data repository designed to facilitate the capture, storage, and provisioning of demographic, psychographic, and behavioral information. IDX would track the source, context, and timing of captured data which allows for various perspectives on a member's identity to be considered. The data would allow for better customer management and monitor across the vast library of NBC assets.

The collection of data across sites, brand and experiences would enable multiple views of a member profile and serves many needs including membership analytics, targeted advertising, and creating enhanced user engagements with more personalized experiences.

Idea

My focus was on designing a tool to address the business needs that wasn't overwhelming and utilitarian to the user. Before documenting any UI pieces, it was imperative to analyze all the information collected by the product team and participate in brainstorming sessions to comprehend of all the moving parts.

It was imperative to have a developer present during our strategy sessions based on apparent limitations of the back-end technologies on which the platform was being deployed. Below are a some of the features/requirements that were of high importance: -

- self-help videos
- clear milestones to support modular design/development cycles
- back-end support for images, icons & avatars to humanize and soften the UI
- a charting engine or the ability to reference 3rd party tools/APIs for displaying rich interactive charts

Solution

Flow diagrams were prepared to communicate the logic of each actor within the system. The completion of these user/data flow diagrams paved the way for the data taxonomy and interface design.

Following the order of importance for each user stories and platform milestone, individual pieces of the product were designed and present during our daily scrum sessions for sign-off. Next steps were to provide support for the visual designers, developers and QA team with answering questions with resolving any potential issues.

Result

Within the agile development methodology, the team meticulous design and built a platform that streamline the capturing of user registration data across the NBC network. The IDX product enforced authentication in a multi-tier architecture and offered basic charting to communicate reporting metrics.

Other 31

- Member Data Lookup 32
- Support Member Data Population, Modification, and Retrieval by Other Applications (IDX APIs) 33

User / Data Flow Diagrams

Assumptions

- Some initial users, clients, brands and sites will be setup and configured within the system
- Flows assume the user taking action has the appropriate rights assigned either at the brand level and/or global level.
- Every action by user is recorded in the history of changes such that a user can view a details log of events.

Role Definitions

- Member – An individual that engages with a brand site. A member (visitor, or consumer) creates an account with a brand.
- User – A user of the IDX system. This individual can be an external or internal to NBCUniversal. Users may have access to data from an individual site, multiple sites, a brand or multiple brands.
- Client – Any application, internal or external to NBCUniversal, that interacts with IDX.
